BTEs – Business Transaction Events

17 47 196,472

Follow

Like

RSS Feed

Business Transaction Events (BTEs) have been available as of Release 4.0 and are another technique for implementing program exits, and only program exits.

BTEs are generally found in the general ledger accounting (FI-GL), account receivable and payable (FI-AR and FI-AP) and sales and distribution components.

A BTE has a predefined interface and allows you to attach additional functionality in the form of a service function module. You must create function module with the

parameters you have previously dictated. The BTE is called by the SAP standard program by a call to function OPEN_FI_PERFORM_ or OUTBOUND_CALL_. This function checks if there are any active BTEs according to customizing.

According to its Interface there are 2 types of BTEs:

Publish & Subscribe interfaces. Can not update data. Possible to have multiple implementations

Process interfaces. Can update date. Only one active implementation

How to find a BTE (2 ways)

- Search the source code for for "OPEN_FI_PERFORM" og "OUTBOUND_CALL_"
- Use transaction FIBF menu Environment->Info System (P/S). Use the Documentation button to see the documentation for the BTE.

00001041	REVERSE CLEARING: With Reversal of Clearing Doc.
00001050	POST DOCUMENT: Accounting interface
00001060	POST DOCUMENT: Invoice check
00001070	POST DOCUMENT: GUI Callup at Line Item Level
00001080	POST DOCUMENT: Key Texts
00001085	POST DOCUMENT: Functions for Line Item
00001110	CHANGE DOCUMENT: Save the standard data
00001120	CHANGE DOCUMENT: GUI Callup at line item level
00001130	CHANGE DOCUMENT: Key texts
00001135	CHANGE DOCUMENT: Excl. Functions for Line Item
00001136	CHANGE DOCUMENT: Exclude Field Changes

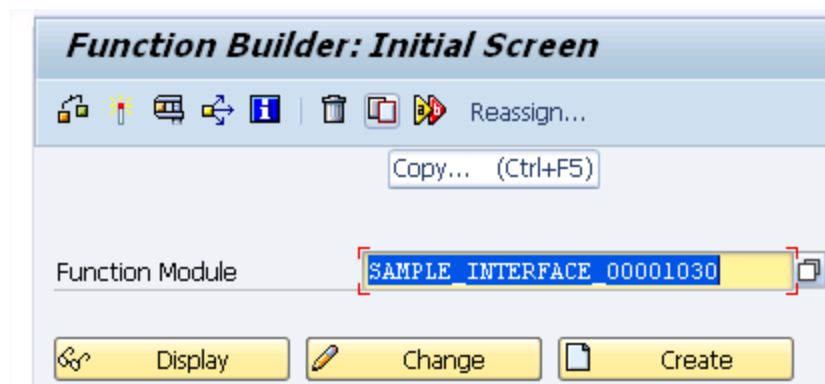

Implementing the BTE

- Goto transaction FIBF menu Environment->Info System (P/S)
- Select the BTE you want to implement. (as below)

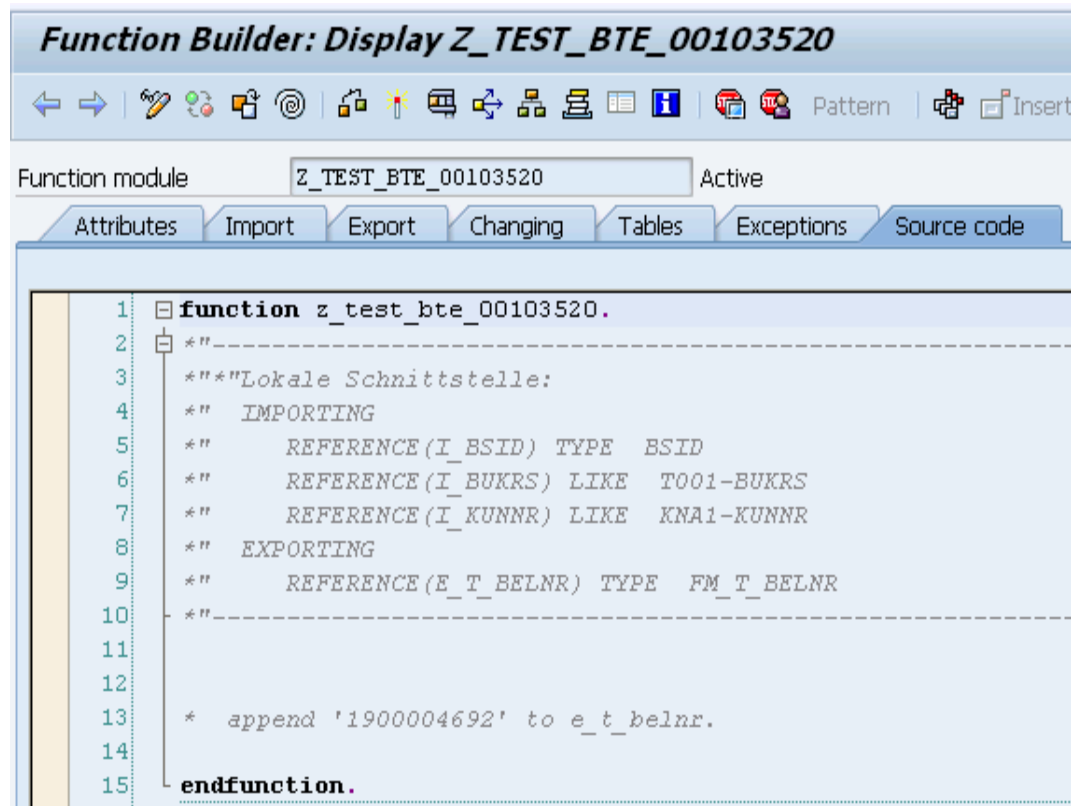

- Double click on Sample function module 
- Then we copy the sample function module to a Z-function module (First create a new function group for the function module).

Note: The name of the Z-function module is not important

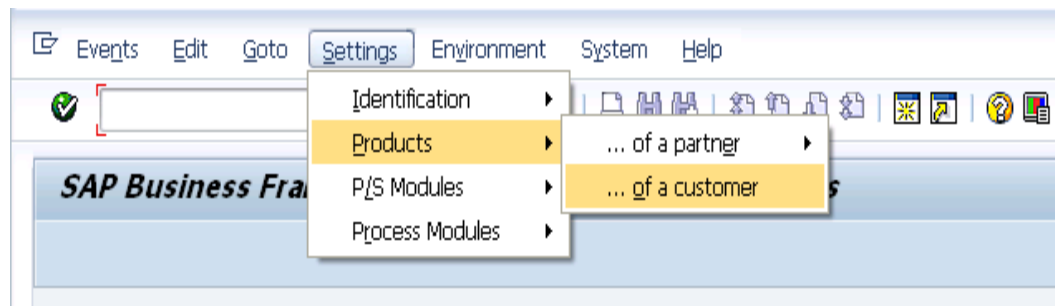

- Edit the code in the new function module:

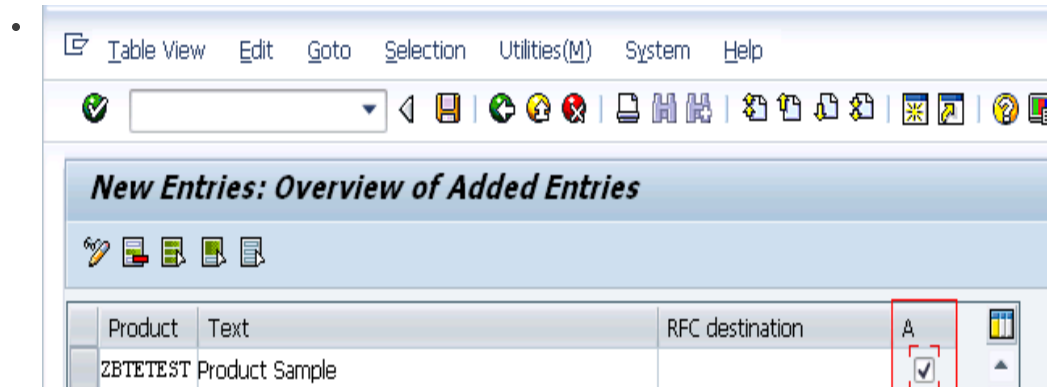

- Go back to transaction FIBF – Menu Settings->Products -> Of a customer and create a new product which identifies the new product .

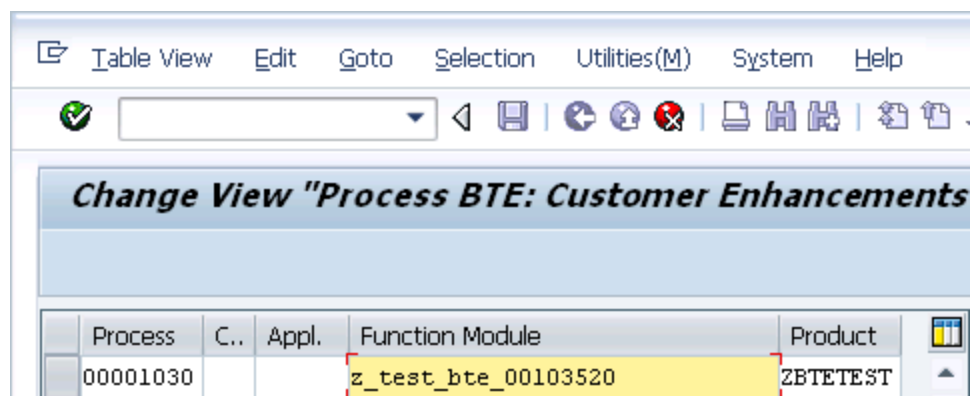

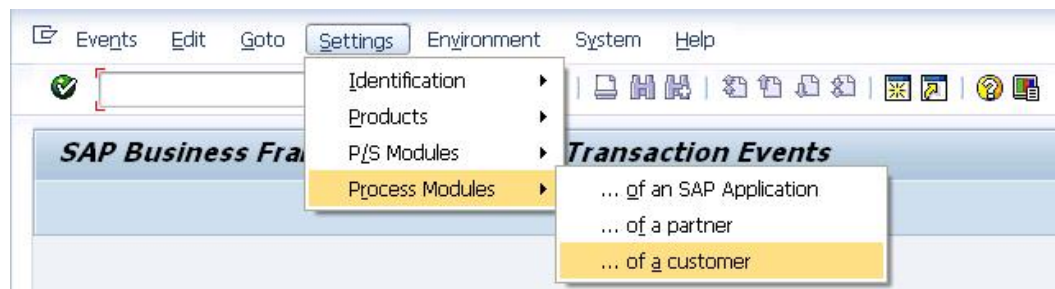

Remember to mark the Active field.

- We enter the product name description and RFC destination if applicable. The check box A is to activate the product.

- The next step is to link the function module and the event using the product created. Go back to FIBF menu Settings->P/S function modules->of a customer – Create an entry that links the BTE and Product with the new function module (as below)

- And that's all, we only need to save and activate. 😊

Another interesting aspect of these events is that the R3 Adapter of the CRM middleware uses these exits to trigger the outbound flow of changes in ERP to CRM and also to enhance the standard transfer on the outbound ERP to CRM side.

Take care,

Stephen

Nice, simple explanation. But if the Z-FM is created in a separate function group, won't it lose all the global data that is in the function group of the original FM?

These are supposed to work with the idea you can only process the data you are given as these are exits. Never been a problem in my experience when used for SAP CRM middleware processing.

Very nice sharing, Borja. We are applying what you mentioned above in our project. However, we may miss something, so that it leads the function module cannot be called in the transactions. Our case is bellow, could you please help us to check and give us an advice.

We want to use FM ZSAMPLE_PROCESS_00001610 which is copied from SAMPLE_PROCESS_00001610, to calculate the value date and update it when running payment proposal by F110.

To realize it, here bellow is what have done in BTE settings:

(1) Configure: Settings>Products>...of a customer.

Create the product: **Z_1610**, and activate it.

(2) Configure: Settings>Process Modules>...of a customer.

Select process 00001610, FM: ZSAMPLE_PROCESS_00001610, product: **Z_1610**

To validate the FM is activated in F110, we set up a break point in function module. and Here bellow is the testing FM:

FUNCTION ZSAMPLE_PROCESS_00001610.

*"-----

""Local Interface:

*" IMPORTING

*" VALUE(I_PAYRQ) LIKE PAYRQ STRUCTURE PAYRQ

*" EXPORTING

*" VALUE(E_VALUT) LIKE SY-DATUM

*"-----

BREAK-POINT.

I_PAYRQ-VALUT = '20150227'.

E_VALUT = I_PAYRQ-VALUT.

ENDFUNCTION.

That is all. Highly appreciated for your advice.

Eric

Thanks, very helpful...

Can we apply this for another module (SD, MM...)

I tried to use with Tcode MIRO, but it can not trigger debugging.
